

## High-precision optical path switching switch

### Overview

These devices enable high-precision control of light paths in fiber networks with minimal loss, rapid switching performance, and rugged instrumentation-ready design, ideal for optical communication systems, research labs, and photonic instrumentation. Keysight optical switches enable high-performance, multichannel optical signal routing for automated and manual test applications. A selection of high damage threshold, acousto-optic Q-switches is available. 2 dB), fastest switching speed (10 ns), broadest wavelength range (300–2400 nm), widest fiber compatibility, highest optical power handling (50 W), and space-qualified reliability. Unlike optical modulators, which are designed for continuous analog variation of amplitude or phase, switches are typically. Mechanical Optical Switches: Switching times typically range from 1-10ms, suitable for long-distance transmission scenarios where latency is not critical (such as backbone network protection switching).
