

How to adjust the fiber optic patch cord to the A and B ends of the flange

Overview

Replace the patch cord type (for example, switching from an A-B to an A-A patch cord) to realign the Tx/Rx pathways. Another method is to use polarity-flipping MTP®/MPO Pro cables that reverse the fiber positions without requiring physical rewiring. When facing an open port in the "Keyup" position, "B" will always be on the left and "A" will always be on the right. A link's transmit signal (Tx) must match its corresponding receiver (Rx) at the other end. Although it may seem obvious, fiber optic polarity is a frequent source of confusion and. In fiber optic cabling, the core objective of polarity management is to ensure. Thus, when connecting patchcords, fiber 1 (or the odd numbered fibers) can always go to the transmitter and fiber 2 (or all even numbered fibers) goes to a receiver and proper connectivity is maintained, allowing the use of straight through duplex patch cords.
