

Standards for Dust and Water Protection Requirements of Distribution Boxes

Overview

IEC 60529-2, commonly referred to as the IP Code standard, provides a comprehensive framework for assessing the degree of protection offered by enclosures against the ingress of foreign objects, dust, and water. Enclosures are essential for safeguarding electrical equipment and devices from environmental elements such as dust, water, and physical impacts. The first digit is our shield against these invaders: IP5X (Level 5): Dust-resistant—keeps out most particles but not completely dust-tight. In this guide, we'll break down what IP67, IP68, IP40, IK09, and common NEMA enclosure types really mean. More importantly, we'll show you how to decide which enclosure best fits your. This guide breaks down IP ratings in plain language and explains how to pick the right weatherproof junction box. We'll also look at related products — such as distribution boxes, switchgear, and dry-type transformers — that often require the same protection standards.
